

RESEARCH TECHNICIAN OPPORTUNITY AT HARVARD  
MEDICAL SCHOOL, BRIGHAM AND WOMEN'S HOSPITAL

## Immunogenomics technician to apply new technologies in the exploration of autoimmune disease

The Raychaudhuri Lab at Harvard Medical School invites applications for a research technician position in an immunogenomics laboratory with an interest in understanding the basis of autoimmune disease. Our group uses cutting edge technologies including mass cytometry and single cell RNA sequencing to characterize variation within the immune system. By partnering these techniques with a firm background in computational genetics, we aim to use these methods in understanding the basis of autoimmune disease.

Candidates should have a bachelors degree in biological sciences by start date. Experience working in the laboratory, particularly with immunological methods, is preferred. Familiarity with statistical data analysis is preferred. Our group is highly collaborative, working with investigators from Harvard Medical School, the Broad Institute, and Brigham and Women's Hospital. The person hired for this position will necessarily work closely with a team of scientists of broad expertise brought together from these institutions.

Interested candidates should submit a current CV and names of three references to Dr. Raychaudhuri ([soumya@broadinstitute.org](mailto:soumya@broadinstitute.org)) directly.
